

Borostix is a very cheap coloured borosilicate glass. The rectangle rods are appr. 95mm long and have an edge length of 7,5 x 6,5mm.

Borostix is produced by injecting colour bringing oxides followed by pressing into a form. This glass tends a little more than other coloured borosilicate glass to outgassing which makes a good working place exhaust necessary.

Borostix is floating easier on clear glass surfaces than other Borosilicate glass does. This easier floating ability is caused through a higher coefficient of expansion, we recommend our customers to make a compatibility check for the respective application.
